

Scale replication — does the ranking survive ViT-G · 2B → ViT-g · 1B? (all 15 metrics, panels sorted by ρ desc · title colour: green $\rho \geq 0.5$ replicates · grey 0.2-0.5 inconclusive · red $\rho < 0.2$ fails · dashed = identity $y=x$)

[!] does NOT replicate ViT-G · 2B → ViT-g · 1B ($\rho < 0.2$):

- temporal-order (frame-permutation) acc ($\rho = 0.02$)
- free-running exposure-bias gap ($\rho = -0.25$)
- rollout drift slope ($\rho = -0.60$)
